

Constructive features **DN40÷DN600**

The upper stem is locked by manual or motorized control while the O-ring assures a life-time lubrication. Moreover, a mark is machined on the top part of the stem, which reproduces exactly the disc position, when the valve is inserted between the flanges.

The one-piece valve body casting ensures high strength with minimum weight. It can be supplied in a wide choice of materials, for both WAFER and LUG models, so as to meet all possible installation requirements.

The stem has a square end which fits directly in the disc; hence no fastening elements are needed. This allows the disc to float on the stem and to be self-centering inside the seal so as to form a continuous tight shut-off line with the latter. Thanks to the special shape of the SIRCA disc, pressure drops and forces of rotation are appreciably reduced.

Thanks to the special internal profile of the surface of contact between disc-seat, the reciprocal back pressures ensure tight shut-off.

The resilient seat is vulcanized on metallic support ring. Thanks to its straight-forward design it is easily replaceable without use of special tools.

Thanks to the special profile of the seat, no seal is required between the flanges. while the O-ring assures a life-time lubrication. Moreover, a mark is machined on the top part of the stem, which reproduces exactly the disc position, when the valve is inserted between the flanges.

- **Corrosion and abrasion resistant** only the seat and disc are in contact with the fluid.
- **Self-cleaning** and two-way (therefore the valve can be mounted in both direction of flow).
- **Seat** with internal metallic support ring to ensure geometric and dimensional stability.
- **Disc** self-centering inside the seat thanks to the floating coupling between stem-disc.
- **Stem-disc coupling** without use of fastening elements (screw bolts, etc.) which could be sources of corrosion and failures.
- **Disc of special design** in order to ensure ample full flow, low pressure drops, and minimum turbulence.
- **Valves** are in according to I.S. EN 558-1 API STD 609 - MSS SP 67 - ASME B16.5 / B16.34.
- **Maximum** ease of assembly and maintenance: no additional seals are required for mounting between the flanges, nor lubrication.
- **Adaptability** to any type of pneumatic or electric actuator.
- **Protection** of the valve outer parts against corrosion (epoxy or polyurethane paint).
- **Good** adjustment characteristic.
- **Tight shut-off** with pressure drop up to 20 bar.
- **Favourable cost.**
- **Very compact** size and light weight.

Size range	1.1/2" ÷ 40" (DN40 ÷ DN1000)
Type	Wafer, Lug, Double flanged
Face to face dimension	EN 558 series 20
Top flange	ISO 5211
Max working pressure	20 bar - bidirectional
Flange drilling	PN6, PN10, PN16 / ANSI class 150
Operating temperature	-20 °C ÷ +160 °C (-4 °F ÷ +320 °F)
Standard materials	Body: Ductile Iron, Carbon Steel, Stainless Steel, Al/Bronze, F51 Disc: Ductile Iron, Carbon Steel, Stainless Steel, Al/Bronze Stem: AISI 316, AISI 420, AISI 630, MONEL K Seat: NBR, EPDM, EPDM HT, VITON, more (all seats have inside a metal ring reinforcement)
Leakage class	Rate "A" - No leakage – according to EN 12266-1
Applications	Liquids or gases in industrial environments, plants, water treatment, vacuum, other applications with compatible materials to working conditions
Certifications	2014/68/EU PED, 2014/34/EU ATEX, SIL IEC 61508 - IEC 61511 GOST-R, CU TR 10 – CU TR 32, TA-Luft

DN 40 ÷ DN 300 (1½" ÷ 12")

* Only for valves with body in steel material.

DN 350 ÷ DN 600 (14" ÷ 24")

** Only for 18"-20".

NOTE:

Special materials, are available on request.

General features **DN700÷DN1000**

The butterfly valve 301 series bears to satisfy applications as interception and regulation of fluids in plants for big diameters (DN700÷DN1000).

Project Design

The valves are built in diameters from DN700 up to DN1000. The valves have a perfect held “bubble tight shut off” in every direction of fluid at maximum rating application. The Seat is constituted by matter of vulcanized rubber on a metallic support that allows geometric stability. The disc is very wide in order to have low drop of pressure and minimum turbulence. The body and the shafts are always protected from the fluid, only the seat and the disc are in contact with the fluid. Easy to adapt to any type of actuator: pneumatic, electrical, hydraulic or handwheel and gear devices. The body has an epoxy painting that protects the valve from corrosion and makes it suitable for marine atmosphere. The valve is self-cleaning and it has double tightening on the shafts. The one-piece cast can be supplied in different materials in Wafer, Lug and Flanged application.

One of the many advantages of this valve is the low Weight that allows an easy installation and the low cost with the guarantee of a safety technical application.

Butterfly Valves 301 series are bidirectional and have the seal constituted by a particular seat with a wide gauge bigger than face to face of the valve’s body, so it’s possible to install the valve without the use of added seals.

These valves are available in Wafer, Lug and Flanged applications.

The **Wafer** type has four throughout threaded holes according to actual flanges norms.

The **Lug** type has ears with threaded holes according to actual flanges norms.

Also the **Flanged** Valves have the threaded holes but for this application there are not ears on the valve’s body, in fact the Flanged valve’s body is made by two flat faces similar to two flanges.

All sizes of 301 series can be mounted on the flanges according to actual flanges norms, UNI EN 1092-1 for PN6-10-16 and ASME B16.1 for ANSI150.

The easy structure of the valve and the employment of few components of the valve during the action of the same, guarantee the long life of the valve and besides they reduce the maintenance operations. The large choice of material at disposal and the possibility to execute particular applications, like coverings of components of the valve, give to this valve a large variety of fields of application.

Technical Features

The one-piece cast can be supplied in different materials in Wafer, Lug and Flanged application.

The rounded profile of the Disc, and the particular shape of the Seat allow to obtain a low torque during the closing-action and guarantee a perfect bubble tight shut off.

The high resistant shafts enter into the discs for 2/3 of the diameter of the disc.

The shafts are guided by bushings with internal and external O-rings that guarantee a good operation and avoid that powders and liquids go inside the body or be in contact with the shafts.

The shafts are fixed onto the discs with special screws.

The butterfly valves 301 series has also in the lower part a plug with O-ring that locks the lower shaft and eliminates the leakages towards the outside.

NOTE:

The table above gives the recommended maximum torque values to be applied to the SIRCA butterfly valves. They represent the sum of the amounts of the mechanical friction caused by opening and closing the valve in relation on the various pressure drops. These torque do not include the safety value, besides these values apply to any type of application.

VALVE SIZING

Nominal valve diameter is determined by calculating the CV* coefficient on the basis of actual fluid operating conditions. Determine the valve size in the table below so that the CV* calculated by the formula is about 80% of the CV in the table.

CV values

CV* (pure number) gives the flow rate of water in U.S. gallons per minute passing through the valve, creating a pressure drop of 1 psi at a temperature of + 68° F (American units). In metric units this coefficient is defined as the KV which likewise represents the flow rate in m³/h passing through the valve with a pressure drop of 1 bar at a temperature of 20° C. The relation between CV and KV expressed in the above units is as follows: CV= 1.16 KV.

Butterfly valve
with pneumatic actuator AP model
double acting or spring return type.

Butterfly valve
with 10 position leverlock.

Butterfly valve
with reduction gear and handwheel.

Butterfly valve
